ABOUT ME

My research interests are in the area of graph analytics with a particular focus on a new class of networks called Temporal Interaction Networks (TINs). In these networks, a quantity (flow) transfers from one vertex to another within a time window. TINs can model dynamic systems where entities exchange quantities, such as financial transactions, transportation flows, or communication data. Over the past few years, I have been developing efficient solutions to optimize classical problems (e.g., max-flow computation) by introducing the temporal dimension.

Currently, I am working on provenance tracking for streaming systems, where understanding how outputs are derived from inputs is critical for debugging, auditing, and explainability. I am developing how-much provenance, a new model that reports how much data each source contributed to an output, or to all outputs of a sink within a time window, without tracking individual tuples. I am also working on downstream provenance, which reverses this direction: it starts from a problematic source and identifies how many outputs that source fed, over an interval of production time and along a processing path.

EMPLOYMENT

Hong Kong University of Science and Technology (HKUST), Hong Kong SAR Postdoctoral Fellow, CSE Department	2025 – present
University of Hong Kong (HKU), Hong Kong SAR Part-time Lecturer, CS Department	2025
University of Hong Kong (HKU), Hong Kong SAR Postdoctoral Fellow, CS Department	2023 – 2025
University of Hong Kong (HKU) & MTR Corporation, Hong Kong SAR Research Assistant	2022
University of Ioannina (UoI), Greece Software Engineer - Working on different research projects (ProximIoT & SmartCityBus)	2020 - 2023
University of Hong Kong (HKU), SAR Research Visitor, CS Department	2019
University of Hong Kong (HKU), SAR Research Assistant, CS Department	2018

EDUCATION

Ionian University, Greece BSc in Computer Science ◦ <u>Thesis</u>: Sentimental Analysis in Social Networks ◦ <u>Advisor</u>: Phivos Mylonas	2013 – 2017
University of Ioannina (UoI), CSE Department, Ioannina, Greece MSc in Computer Science ◦ <u>Thesis</u>: Flow Motifs in Interaction Networks	2017 – 2018

- Advisor: Nikos Mamoulis

University of Ioannina (UoI), CSE Department, Ioannina, Greece
Ph.D in Computer Science

2019 – 2023

- Thesis: Flow Analytics in Large Graphs
- Advisor: Nikos Mamoulis

ACADEMIC SERVICE

Organization Committees

Co-chair for TKDE posters @ICDE
Publicity chair for @MDM 2026

TEACHING EXPERIENCE

The University of Hong Kong (HKU), CS Department, Hong Kong SAR
Course Title: Network Data Analytics

Spring 2025

- Instructor

University of Ioannina (UoI), CSE Department, Ioannina, Greece
Course Title: Complex Data Management

2019-2023

- Teaching Assistant

University of Ioannina (UoI), CSE Department, Ioannina, Greece
Course Title: Object Oriented Programming

Spring 2018

- Teaching Assistant

University of Ioannina (UoI), CSE Department, Ioannina, Greece
Course Title: Introduction to Programming

2017-2022

- Teaching Assistant

HIGHLIGHTS

Temporal Interaction Networks (TINs) Temporal Interaction Networks (TINs) are a graph-based formalism for modeling time-varying data flows. Specifically, this type of network models dynamic systems where entities exchange quantities, such as financial transactions, transportation flows, or communication data. They can be used in a variety of problems; for computing the max-flow quantity from a source to a sink vertex to tracking the origin of a transferred quantity among the vertices (provenance).

BEACON - A Benchmark for Efficient and Accurate Counting of Subgraphs BEACON is a scalable and standardized dataset designed to evaluate ML-based techniques. It provides a unified dataset with ground truth subgraphs and different types of graphs (e.g., directed and undirected, weighted and unweighted).

SKILLS

Programming Languages

C, C++, Java, Python

Environments

MATLAB, Octave, QGIS, Neo4j

Operating Systems

Windows, MacOS, Linux

STUDENT SUPERVISION

PhD Students HKU

- Carrie Wang - working on hypothesis testing on graphs
- Xiangju Zhu - working on subgraph counting problems
- Matin Najafi - worked on subgraph counting problems, now a researcher at Huawei, Hong Kong

Bachelor Students UoI

- Ioanna Papayianni (2020) - Thesis: Developing efficient algorithms for analyzing flow patterns in large networks
- Dimitris Zervas (2021) - Thesis: Detecting the origin of transactions in the Bitcoin Network
- Sotiria Kastana (2021) - Thesis: Design and development of a synthetic indoor movement generator
- Vasileios Georgoulas (2023) - Thesis: A web application for passenger movement with public transport
